Problem: Numerical computations with input.

Write some python code that prompts the user for their height in feet and inches and then outputs their height in total inches.

```
In [ ]:  print("Program to Convert Feet and Inches to Total Inches")

         fni = input("Please enter your height in feet and inches seperated by a comma: ")

         fni = fni.split(",")

         feet = float(fni[0])
         inch = float(fni[1])

         tot_inches = (feet * 12) + inch

         print(f"{feet} feet and {inch} inches equals to {tot_inches} inches in total.")
```

```
Program to Convert Feet and Inches to Total Inches
Please enter your height in feet and inches seperated by a comma:  5,10
5.0 feet and 10.0 inches equals to 70.0 inches in total.
```
